Approved for public release; distribution unlimited

SUMMARY PAGE

THE PROBLEM:

To provide a status report on the Computer-Assisted Program for Diagnosis of Chest Pain. This document will serve as the basis for a reference manual and guide to the Chest Pain Patient Management System as it develops.

THE FINDINGS:

Presentation is made of the general aspects of chest pain diagnosis, program capabilities, computer operation, descriptions of program elements, programming flowcharts, programming statements, and general information necessary for system utilization.

APPLICATION:

The information presented will be of value as a reference guide to the present system as it evolves through addition of ECG components, an updated database, and treatment and training modules.

ADMINISTRATIVE INFORMATION

This report was submitted for review in April 1984 and approved for publication on 27 April 1984. It is designated as NAVSUBMEDRSCHLAB Report #1019.

ABSTRACT

Chest pain is the presenting symptom for several very serious illnesses, some having potentially fatal outcomes. In addition, chest pain has been reported to be one of the most frequent causes of medical evacuation from submarines. The Naval Submarine Medical Research Laboratory is developing programs, in the style of the computer-assisted diagnosis program for acute abdominal pain, to assist the submarine corpsman in the diagnosis, triage, and management of chest pain illness. The purpose of the present report is to summarize and document the progress to date on the computer-based diagnostic program for chest pain. The disorders considered are: myocardial infarction, angina, pneumonia, pneumothorax, and non-specific (non-life-threatening) chest pain. A very preliminary version of a program to predict outcome of M.I. (myocardial infarction) is also presented.

As it stands, the chest pain diagnostic/prognostic program described here is not ready for clinical use. Revision of both parts of the program to incorporate ECG measures and recent findings regarding the indicant-disease relationships is in progress.

SECTION 1 - INTRODUCTION

Medical evacuation from a patrolling nuclear submarine is costly in terms of risk to the patient, the expense of evacuation, and the compromise to the mission of the submarine. The medical responsibilities are borne by the Independent Duty (8402) Corpsman who must independently diagnose and manage any illness which presents during patrol. This includes making recommendations regarding evacuation to a shore-based facility. His diagnostic task is complicated by mission constraints which often prevent communication with shore-based medical facilities and by the limited medical diagnostic equipment aboard nuclear submarines; lacking, for example, X-ray facilities as well as many laboratory tests normally relied upon in the hospital or dispensary setting.

Chest pain is the presenting symptom for several very serious illnesses, some having potentially fatal outcomes. In addition, chest pain has been reported to be one of the most frequent causes of medical evacuation from submarines. The Naval Submarine Medical Research Laboratory is developing programs to assist the submarine corpsman in the diagnosis, triage, and management of chest pain illness. A program, in the style of the computer-assisted diagnosis program for acute abdominal pain (Arthur, NSMRL Report #974), is under development. The purpose of the present report is to summarize and document the progress to date on the computer-based diagnostic program for chest pain.

As it stands, the chest pain diagnostic/prognostic program described here is not ready for clinical use. Revision of both parts of the program to incorporate ECG measures and recent findings regarding the indicant-disease relationships is in progress.

SECTION 2 - THE DIAGNOSTIC PROGRAM

2.1 INTRODUCTION

To date, there is one component of the computer-assisted diagnosis/management program for chest pain, the diagnostic/prognostic program. This section will detail the function and use of this program.

To avoid redundancies, the reader is directed to NSMRL report #974: Computer-assisted Diagnosis Program for Acute Abdominal Pain by LCDR Donald C. Arthur, MC, USN, which contains an excellent guide to basic computer interaction in section 3.5.

Since the chest pain program is patterned after the abdominal pain program, all of the cautions regarding the importance of accurate data collection and precedence of corpsman judgment apply to this program as well.

Inserting the tape and pressing 'AUTOLOAD' will load the introductory page (FIGURE 2-1). This page will remain on the CRT screen while the diagnostic program is loaded into the computer memory.

FIGURE 2-1

Developed by:

NAVAL SUBMARINE MEDICAL RESEARCH LABORATORY
Box 900 SUBASE, NLON
GROTON, CONNECTICUT 06349
Phone: (203) 449-3668, 4894
Autovon 241-3668, 4894

After the diagnostic program is loaded, the initial choice page will be displayed (FIGURE 2-2).

FIGURE 2-2

- OPTIONS...
1. To get DEFINITIONS of datasheet items
 2. To access a TREATMENT PROGRAM
 3. To access the TRAINING PROGRAM
 4. To go directly to making a DIAGNOSIS

OPTION:

Selection of either the TREATMENT PROGRAM or the TRAINING PROGRAM will yield an explanation that these programs have not yet been developed and return the user to the initial choice page.

Selection option 1, the DEFINITIONS choice, will yield a list of the symptom categories included in the diagnostic program. The user selects a definition, enters the corresponding number and then presses 'RETURN' to have the definition displayed. See Section 2.2 for the definitions.

WHICH DEFINITION WOULD YOU LIKE :

When the user proceeds to the diagnostic program (Option 4, FIGURE 2-2), two display pages will give brief explanations regarding data entry (FIGURE 2-4) and interpretation of diagnostic probabilities (FIGURE 2-5).

FIGURE 2-4

- REMEMBER...
1. Use DATASHEETS when entering data.
 2. Enter information by CODE NUMBER.
 3. Follow each code number with RETURN.
 4. RE-ENTER codes to erase.
 5. INPUT CHANGES can be made at the END.
 6. Press RETURN to go on to next page.

Press RETURN to continue.

FIGURE 2-5

The computer-assisted diagnosis program can aid the Corpsman in differentiating illnesses which represent both the most common and most serious causes of acute chest pain.

The 5 illnesses which are considered by the computer are MYOCARDIAL INFARCTION, ANGINA, NON-SPECIFIC CHEST PAIN, PNEUMONIA AND PNEUMOTHORAX. Non-specific chest pain is intended to include those cases which are non-surgical, not life-threatening, and, therefore, not reasons for evacuation.

In addition to diagnosis, the chest pain computer program provides probabilities for the occurrence of 3 classes of post MI complications. These are: NO PROBLEMS, ARRHYTHMIA, and PUMP FAILURE. It also predicts the likelihood of LIFE/DEATH post MI.

IMPORTANT: Supplemental programs for the prediction of complications and the prediction of life/death are used only with cases of MI.

THE CORPSMAN'S JUDGMENT MUST TAKE PRECEDENCE when any doubt exists. The computer does not have the capability to think or make the subjective evaluations which are so important in medical diagnosis.

Press RETURN to continue.

The user will then be given the option of reviewing the last case. This option is provided as an aid to memory when the course of disease in a patient is being followed over time. The simulation option is a self-instruction program (FIGURE 2-6).

FIGURE 2-6

PROGRAM TO AID IN DIAGNOSIS OF ACUTE CHEST PAIN

WOULD YOU LIKE TO REVIEW THE LAST CASE?

(Y or N) : N

IS THIS CASE A SIMULATION ?

(Y or N) : N

The program then requests some preliminary information (FIGURE 2-7).

SOCIAL SECURITY NUMBER: the entry must be 11 characters including spaces or dashes between numbers as shown below.

TIME AND DATE: the time and date must be entered in the spaces marked on the display. For example: ____/____ should look like 1400/ 03 Nov 83 after data entry.

AGE: enter the patient's age. Only ages in the range 10 - 99 are accepted by the program. The data base for submarine use applies only to the ages 17 - 60.

FIGURE 2-7

Enter Patient SSN: 123-45-6789

Enter Time/Day Month Year: 1000 / 30 OCT 83

Enter Patient AGE: 37

Once the preliminary data have been entered, the computer program sequentially displays each of the 7 data pages. FIGURES 2-8 through 2-14 present the pages with sample entries. To complete the pages, those numbers of the data sheet items recorded during the patient examination are entered on each page as re-presented on the computer display. After a number is entered and 'RETURN' pressed, the symptom is shown as an "input data code" and circled on the screen. If a symptom number is entered in error, re-enter the number and it will be 'X-ed' out, as in FIGURE 2-8, symptom 10, and deleted from memory. When all desired entries have been made on a page, pressing 'RETURN' one more time will erase the screen and display the next page.

INPUT DATA CODES:						(re-enter codes to delete)
48	51	54	56	57	59	

The program has been designed to minimize the effects of keyboard errors by requiring the input to conform to the anticipated format and content of the information requested. When the input is requested in the form of a 'Y' or 'N' reply, typing any other character or number, or more than one character, will elicit another request for the appropriate input. The erroneous entries are discarded by the program.

FIGURE 2-12

INPUT DATA CODES:				(re-enter codes to delete)
101	103	108		

When the 'RETURN' is pressed after completion of the 7th page of data input, the program will ask the user to enter his preliminary diagnosis (FIGURE 2-15).

FIGURE 2-15

```

1. MYOCARDIAL INFARCTION
2. ANGINA
3. NON-SPECIFIC CHEST PAIN
4. PNEUMONIA
5. PNEUMOTHORAX
6. OTHER
ENTER THE NUMBER OF YOUR PRELIMINARY DIAGNOSIS : 3

```

At this time, the computer-generated probabilities DO NOT AGREE with your preliminary diagnosis. However, as of yet, there are no specific categories which would differentiate your preliminary diagnosis from the current program-generated diagnosis.

WOULD YOU LIKE TO MAKE ANY CHANGES? (Y or N) :

After the user's preliminary diagnosis has been entered, the program compares it with the diagnosis found most probable by the system. The program then tells the user whether the diagnoses agree or not. If the diagnoses are the same, keying 'RETURN' directs the program to construct and display the Case Summary Page. If they are not the same, the user may go on as though the diagnoses agreed, or he may return to any earlier

point in the diagnostic process. In the abdominal pain program, indicants that may differentiate between the Corpsman's diagnosis and the computer's are named. That aid will be built into future versions of the chest pain program. The alternatives include revision of previous entries by responding Y to the prompt, "WOULD YOU LIKE TO MAKE ANY CHANGES." If the user selects 'OTHER' as his preliminary diagnosis, the program merely states that it does not consider any diagnosis other than those listed (in FIGURE 2-15).

FIGURE 2-16 presents the Case Summary Page for the symptoms entered in FIGURES 2-8 through 2-14. The Case Summary Page lists the HISTORY and PHYSICAL EXAM items in separate columns so that the user may review his entries for accuracy one more time. The probabilities of the 5 diagnoses relative to each other are shown below the indicants calculated as percentages. In addition, a bar graph displays the percentages for easy visualization of the program's findings. The time, date and location (unit name) of the examination, the patient's SSN and age are shown at the top of the page. This form can be used as an entry in the patient's health record with addition of the patient's name, the practitioner's name and signature, and the designation 'SF-600'. However, it must be reproduced on a medium more stable than the product of the Tektronix hard copy unit. The latter darkens over time, particularly if exposed to light.

FIGURE 2-16

1008 30 OCT 83 NAUSUBNEDRSCHLAB		PATIENT SSN: 123-45-6789 AGE: 37

		NEXT INTERACTION 1. Change Input Data 2. Another Diagnosis 3. Display Treatment 4. Obtain Definition 5. End interaction											
CHOICE: <table border="1"> <tr> <td>0.3%</td> <td>0.8%</td> <td>23.2%</td> <td>75.9%</td> <td>0.6%</td> </tr> <tr> <td>M.I.</td> <td>ANGINA</td> <td>NONSCP</td> <td>PNEUMO</td> <td>THORAX</td> </tr> </table>		0.3%	0.8%	23.2%	75.9%	0.6%	M.I.	ANGINA	NONSCP	PNEUMO	THORAX		
0.3%	0.8%	23.2%	75.9%	0.6%									
M.I.	ANGINA	NONSCP	PNEUMO	THORAX									

The Case Summary Page presents 5 or 6 options for the next interaction to the user. The options are to change some of the input for the present case and request another calculation, to enter a new case, to access the treatment program, to access the item definitions, to enter the cardiac prognosis program, or to end the computer interaction. In its present form, the cardiac prognosis program can be consulted only if the computer ranks Myocardial Infarction as the most probable diagnosis.

If the user chooses to alter some of the data entries for the present case, FIGURE 2-17 is presented. This option allows deletion of entries by entry of their numbers, as in the main program, and entry of additional numbers to replace those deleted or to add to the information previously supplied to the program. Items added should, of course, be consistent with those already available to the program. As before, keying 'RETURN' after the last item has been entered into the computer results in the construction and display of the new Case Summary Page. FIGURE 2-17 illustrates the input change routine with some sample entries.

FIGURE 2-17

<p><u>NEW INPUT :</u></p> <p>15 RADIATION NO 33 PAIN SEVERE</p>	<p><u>DELETIONS :</u></p> <p>14 RADIATION YES 25 RADIATION TO BACK 26 RADIATION TO SHOULDER 32 PAIN MODERATE</p>

<p><u>INPUT DATA CODES:</u> (re-enter codes to delete)</p> <p style="text-align: center;">15 14 -X 25 -X 26 -X 32 -X 33</p>

If the PROGNOSIS program option is chosen, the computer calculates probabilities for three kinds of cardiac problems. The prognostic program uses a new database to calculate probabilities for cardiac problems based on the set of symptoms already entered for the patient. Once the probabilities have been computed, the display will present the symptom set and probabilities for: NO PROBLEMS, ARRHYTHMIA, and PUMP FAILURE (FIGURE 2-18).

FIGURE 2-18

Press Return for LIFE/DEATH Probabilities

CODES (NP/AR/PF)
NP = No Problems
AR = Arrhythmia
PF = Pump Failure

Also included as part of the PROGNOSIS program are probabilities for the likelihood that the patient will either live or die, even if in a hospital setting. For this section of the prognosis program, the computer will ask for additional data input (FIGURE 2-19).

FIGURE 2-19

LIFE/DEATH Probabilities:

BODY BUILD:
NORMAL (1) OBESE (2)

CORSPMAN OPINION OF PATIENT'S CONDITION:
GOOD (3) DUBIOUS (4) POOR (5)

DURATION OF PAIN (refined):
<6NR (6) 6-24NR (7) >24HR (8)

INPUT DATA CODES:

2 4 6 4 5

(re-enter to delete)

The program calculates 'LIFE/DEATH' probabilities using a subset of symptoms entered for the patient. FIGURE 2-20 illustrates the Case Summary Page for the 'LIFE/DEATH' section of the prognosis program. Starred symptoms are ones which contribute to the calculation of the probabilities.

FIGURE 2-20

Following the presentation of the 'LIFE/DEATH' probabilities, the user is given four options. They are to obtain a symptom definition, display treatment information, run a new case, or end the interaction with the computer.

2.2 DATA SHEET DEFINITIONS

The following are definitions of chest pain signs and symptoms. The definitions are accessed through the chest pain DIAGNOSIS program.

DURATION OF PAIN definition:

<1HR (5) 1-2HR (6) 2-4HR (7) 4-12HR (8) >12HR (9)

Here we're interested in how long since the pain began for this episode of illness. Record in hours and minutes.

ONSET OF PAIN definition:

SUDDEN (10) GRADUAL (11)

Determine how long it took the pain to develop fully. If it took less than 2 minutes, write SUDDEN; if greater than 2 minutes, write GRADUAL.

TIME COURSE OF PAIN definition:

CONTINUOUS (12) INTERMITTENT (13)

If your patient has had times when he has been free of pain since it started, circle INTERMITTENT. Otherwise circle CONTINUOUS.

SITE OF PAIN definition:

SUBSTERNAL (16) ACROSS (17) LEFT SIDE (18)
RIGHT SIDE (19) EPIGASTRIC (20) OTHER (21)

This is sometimes hard to express. Look at the choices on your data sheet, then get your patient to bare his chest and show you with one finger where his pain is. Choose the data sheet category which fits best.

RADIATION OF PAIN definition:

YES (14) NO (15)
LEFT ARM (22) RIGHT ARM (23) BOTH ARMS (24) BACK (25)
SHOULDER (26) NECK (27) JAW (28) OTHER (29)

Radiation is pain spreading from a primary site (here, the chest) to other areas. Patients often describe this pain as 'moving' or 'shooting' to the area in question. Ask about each of the possible choices on your data sheet.

NUMBNESS definition:

YES (30) NO (31)

This refers to the present illness only. Your patient may describe this as not having sensation or as a 'tingling' in some area.

SEVERITY definition:

MODERATE (32) SEVERE (33)

This is a judgment you make: don't ask your patient. If the pain is obviously intense, causing obvious distress, sweating, or shivering, circle SEVERE. Otherwise circle MODERATE.

PROGRESS definition:

BETTER (34) WORSE (35)

In general, since it began, is the pain getting BETTER or WORSE? If in doubt, leave blank and skip this entry. There is no SAME category.

AGGRAVATING FACTORS definition:

MOVEMENT (36) COUGH (37) RESPIRATION (38)
SITTING (39) OTHER (40) NONE (41)

This means patient activities which make the pain worse. Ask about each of the data sheet items mentioned in a neutral manner, e.g. 'Does X affect your pain?'

RELIEVING FACTORS definition:

NITRO (42) REST (43) WALKING (44)
OTHER (45) NOTHING (46)

This refers to patient activities which ease the pain. Ask about each of the data sheet items in a neutral fashion, e.g. 'Does X affect your pain?'

NITRO is nitroglycerin, a tablet put under the tongue for angina chest pain. Ask about this even though you feel sure your patient has never used any.

DYSPNEA definition:

NO (47) THIS ILLNESS (48) HABITUAL (49)

This is shortness of breath while not engaged in strenuous activity. Ask your patient if he's felt unusually short of breath, especially while resting. Here it is important to distinguish between chronic dyspnea (circle HABITUAL) and dyspnea that has started recently (circle THIS ILLNESS).

COUGH definition:

NO (50) THIS ILLNESS (51) HABITUAL (52)

Here it is important to distinguish between chronic cough (circle HABITUAL) and cough that has started recently (circle THIS ILLNESS).

NAUSEA definition:

YES (53) NO (54)

This means your patient is feeling sick to his stomach. This may be accompanied by weakness, sweating, and profuse salivation.

VOMITING definition:

YES (55) NO (56)

Here the patient is being sick to his stomach with an appreciable amount of stomach contents expelled. This should be distinguished from 'burping' up small amounts of acid material, which is not vomiting.

APPETITE definition:

NORMAL (57) DECREASED (58)

Here we're interested in RECENT change. Your patient may still feel he can eat, but you wish to know if his DESIRE to eat is decreased. If his desire to eat is the same, write NORMAL, otherwise write DECREASED.

BOWELS definition:

NORMAL (59) CONSTIPATED (60) DIARRHEA (61)

Here we're interested in a recent change. If there has been a marked DECREASE in the number of stools, circle CONSTIPATED, if a marked INCREASE circle DIARRHEA (especially if watery). Otherwise circle NORMAL.

PREVIOUS SIMILAR PAIN definition:

YES (62) NO (63)

Check carefully for times in the past when your patient has experienced chest pain. Sometimes incidents are forgotten. Sometimes they have been concealed to avoid a MEDICAL BOARD.

PREVIOUS CARDIO-RESPIRATORY ILLNESS definition:

YES (64) NO (65)

This refers only to a significant illness involving the cardiovascular or respiratory systems. Ask about, and check his health record for, major illnesses in the past such as high blood pressure, angina, pericarditis, pneumonia, pneumothorax, pulmonary embolism, asthma.

PREVIOUS MAJOR SURGERY definition:

YES (66) NO (67)

This refers to major surgery of any kind. Ask about, and check health records for, major surgery in the past.

TEMPERATURE definition:

<98.6 (68) 98.6-100.2 (69) 100.3-102 (70) >102 (71)

This is self-explanatory. Use oral temperature. Ensure that your patient has not drunk hot or cold liquids during the 15 minutes prior to your measurement.

PULSE definition:

<60 (72) 61-80 (73) 81-100 (74) >100 (75)

Enter the pulse rate in beats per minute. Feel the radial or carotid pulse for one full minute. If you detect irregularities such as extra beats, count the number of times this happens in a minute. (The computer only uses the pulse rate, but you want to be aware if your patient has arrhythmia.)

BP (Blood Pressure) definition:

SYSTOLIC BP:

<100 (76) 101-120 (77) 121-140 (78) 141-160 (79) >160 (80)

DIASTOLIC BP:

<70 (81) 71-80 (82) 81-90 (83) 91-100 (84) >100 (85)

Self-explanatory. Write down the Systolic and Diastolic pressures.

MOOD definition:

NORMAL (86) ANXIOUS (87) DISTRESSED (88)

Don't attempt deep psychoanalysis here. If your patient is obviously reacting to great pain or other severe symptoms, circle DISTRESSED. If he's mainly agitated and worried, circle ANXIOUS. Otherwise circle NORMAL.

COLOR definition:

NORMAL (89) PALE (90) FLUSHED (91) CYANOTIC (92)

Check especially for pallor (unusual absence of color), flushing (unusual ruddiness), or cyanosis (blueness). In whites, check the face and ears. In blacks and whites, check also the extremities and mucus membranes, e.g. nailbeds, nose, lips, conjunctivae.

SWEATING definition:

YES (93) NO (94)

Self-explanatory. We assume that the sweating is not due to an obvious cause such as hot compartment or heavy exercise.

SHIVERING definition:

YES (95) NO (96)

Self-explanatory. We assume that the shivering is not due to a cold compartment.

J.V.P. (Jugular Venous Pulsation) definition:

NORMAL (97) RAISED (98)

Standing on your patient's right, have your patient reclining at a 45° angle, his chin turned about 30 degrees to the left, with a light shining at an angle across his neck so that his right neck vein casts a shadow. It is important to distinguish the pulsation of the external jugular vein from the carotid artery pulse. This can be accomplished by pressing lightly but firmly against the vein at the base of the neck; the vein pulsation will be stopped by this maneuver while the arterial pulsation will not be (since artery pressure is higher).

With the patient in this position and the JVP identified, check in the following way: if the meniscus is seen more than one half of the distance from the clavicle to the chin, circle ELEVATED. Otherwise circle NORMAL. If you're not sure, omit this entry.

An elevated JVP often indicates heart failure.

RESPIRATORY MOVEMENT definition:

NORMAL (99) ABNORMAL (100)

Here we check the amount and pattern of chest expansion. Check for two things.

- A) At the level of the nipples measure the amount of chest expansion with a tape measure or string. If the difference between full inspiration and full expiration is less than 2 inches, circle ABNORMAL (don't draw the tape tightly enough to push in on the skin).
- B) Inspect and palpate with both hands whether expansion is equal on both sides. If obviously different, circle ABNORMAL.

HEART SOUNDS definition:

NORMAL (101) ABNORMAL (102)

With the diaphragm of your stethoscope listen carefully to the first and second heart sounds (LUB-DUB, LUB-DUB). If you can hear anything else or if the heart is irregular, circle ABNORMAL. Otherwise circle NORMAL.

Sometimes changing your patient's position makes auscultation easier: have him sit up, lean forward, lie back, etc., as needed.

Also, in young, healthy men the heart can slow and speed with respiration. This is called sinus arrhythmia, and is NORMAL.

PERCUSSION definition:

		HYPER-
NORMAL (103)	DULL (104)	RESONANT (105)

Be sure to carefully percuss both the front and back of the chest. The best method is to compare sides as you go, left with right. If the sides don't sound the same, there is probably an abnormality. The lungs should normally sound somewhat resonant. If an area sounds markedly less resonant than normal, circle DULL; if an area is markedly more resonant than normal, circle HYPER-RESONANT, otherwise circle NORMAL.

With regard to comparing sides, note that when percussing anteriorly right and left are normally different in two areas: 1) dullness should be present to the left of the lower sternum over the heart and 2) when percussing below the level of the xiphoid (tip of the sternum) there is usually dullness to the patient's right (liver) and tympany to the patient's left (over the stomach). So compare only those areas above the level of the sternum and not over the level of the heart.

CHEST SOUNDS definition:

NORMAL (106) RHONCHI (107) RALES (108) DECREASED (109)

Listen with the diaphragm of your stethoscope to your patient's back. Have him breathe deeply through his mouth and compare right and left sides. If one side is markedly decreased, write DECREASED.

Rales are discrete, non-continuous (crackling) sounds produced by moisture in airways of the lung. Fine rales sound like the rubbing of a lock of hair between your fingers near your ear. Rales are usually heard late in inspiration. If you suspect heart failure, fine rales should be checked for by listening to the lung bases (about 2 finger widths below each scapula) and having your patient cough, then breathe deeply. Coarser rales can be heard elsewhere in the lung in conditions such as pneumonia.

Rhonchi are continuous, musical sounds that range from high-pitched wheezes to lower-pitched moaning. Rhonchi can be both inspiratory and expiratory although they are often more prominent in expiration. They can be heard anywhere over the lungs. Rhonchi are usually heard with infections such as bronchitis or pneumonia, or with airway spasm (asthma).

If breath sounds are not markedly decreased, and if there are no added sounds, write NORMAL.

SGOT definition:

<50 (110) 50-100 (111) 101-200 (112) >200 (113)

Serum Glutamic Oxaloacetic Transaminase was the first enzyme to be widely used as a laboratory diagnostic aid. It begins to rise 12 hours post injury, peaks at 2-4 times normal at 24 hours, and returns to normal in 4-7 days. It is also released from an injured liver and other cells and is thus a sensitive but non-specific indicator. The current terminology is "AST" or aspartate transferase. Facilities for measurement may not be available at sea.

2.3 CHEST PAIN DATASHEET

The chest pain data sheet (FIGURE 2-21) provides the practitioner with a guide to use in performing the history and physical examination and in collecting data from the patient. It consists of 21 history items, including age, and 13 physical exam categories. The findings on these categories are used by the computer program to arrive at a diagnosis. The datasheet pages displayed by the diagnostic program correspond to the format of the paper and pencil datasheet.

In addition to the symptom categories used by the diagnostic program, the chest pain datasheet also includes 3 symptom categories (Body build, Duration of pain (refined, Examiner's opinion of the patient's condition), which are used by the computer program to arrive at a prognosis for patients whose initial computer diagnosis is MYOCARDIAL INFARCTION. These terms are defined on the datasheet; they are not included in the items defined by the section of the program described on pages 14-20.

FIGURE 2-21

CHEST PAIN DATA SHEET

 PATIENT NAME: I. R. SYCK
 SSN: 123-45-6789

 AGE: 37
 DATE/TIME: 30 OCT 83 1000

HISTORY

PAIN

DURATION OF PAIN:

 (duration of this episode of pain)
 <1HR (5) 2-4HR (7)
 1-2HR (6) 4-12HR (8)
 >12HR (9)

ONSET OF PAIN:

 (sudden < 2 Min; gradual > 2 Min)
 SUDDEN (10) GRAADUAL (11)

TIME COURSE OF PAIN:

 (at times free of pain = intermittent;
 everything else = continuous)
 CONTINUOUS (12)
 INTERMITTENT (13)

RADIATION:

 (pain other than in chest area)
 YES (14) NO (15)

SITE OF PAIN:

 (have the patient point with one
 finger to where the pain is)

 SUBSTERNAL (16) RT. SIDE (19)
 ACROSS (17) EPIGASTRIC (20)
 LT. SIDE (18) OTHER (21)

 LT. ARM (22) SHOULDER (26)
 RT. ARM (23) NECK (27)
 BOTH ARMS (24) JAW (28)
 BACK (25) OTHER (29)

NUMBNESS:

 (this illness only; absence of sensation or a tingling feeling)
 YES (30) NO (31)

SEVERITY OF PAIN:

 (do not ask; obvious distress = severe; everything else = moderate)
 MODERATE (32) SEVERE (33)

PROGRESS OF PAIN:

 (general trend of pain rather than short-term changes)
 BETTER (34) WORSE (35)

AGGRAVATING FACTORS:

 (factors which make the pain worse; ask & perform each unless ? Ht)
 MOVEMENT (36) COUGH (37) BREATHING (38)
 SITTING (39) OTHER (40) NONE (41)

RELIEVING FACTORS:

 (activities which ease the pain; ask about each)
 NITRO (42) REST (43) WALKING (44)
 OTHER (45) NONE (46)

OTHER SYMPTOMS

DYSPNEA:

 (shortness of breath; recent = this illness, chronic = habitual)
 NO (47) THIS ILLNESS (48) HABITUAL (49)

COUGH:

 (recent cough = this illness; chronic cough = habitual)
 NO (50) THIS ILLNESS (51) HABITUAL (52)

NAUSEA:

 (feeling sick to stomach)
 YES (53) NO (54)

VOMITING:

 (being sick to stomach)
 YES (55) NO (56)

APPETITE:

 (recent change in appetite)
 NORMAL (57) DECREASED (58)

BOWELS:

 (recent change in bowel habits)
 NORMAL (59) CONSTIPATED (60) DIARRHEA (61)

PAST HISTORY

PREVIOUS CHEST PAIN:

 (pain like this before)
 YES (62) NO (63)

PREVIOUS CARDIO-RESPIRATORY ILLNESS:

 (significant illness either cardiovascular or respiratory)
 YES (64) NO (65)

PREVIOUS MAJOR SURGERY:

 (major surgery of any kind)
 YES (66) NO (67)

 100-120 (77) 70-80 (82)
 121-140 (78) 81-90 (83)
 141-160 (79) 91-100 (84)
 >160 (80) >100 (85)

MOOD:

 (don't ask; obvious distress or physical symptoms = distressed; just
 worried about illness = anxious)
 NORMAL (86) ANXIOUS (87) DISTRESSED (88)

COLOR:

 (consider environmental temp.; check conjunctiva & palms on black & oriental)
 NORMAL (89) PALE (90) FLUSHED (91) CYANOTIC (92)

EXAMINATION

SWEATING:

 (check for sweating not due to environment or exercise)
 YES (93) NO (94)

SHIVERING:

 (check for shivering not due to environment; e.g. cold compartment)
 YES (95) NO (96)

JUGULAR VENOUS PULSE:

 (pt. reclined at 45 degrees, chin 30 degrees to left; meniscus more than
 1/2 of the distance from clavicle to chin = elevated; otherwise circle normal)
 NORMAL (97) RAISED (98)

RESPIRATORY MOVEMENT:

 (abnormal = the difference between full inspiration & full expiration is
 less than 2 inches or expansion is unequal between sides; otherwise
 circle normal)
 NORMAL (99) ABNORMAL (100)

HEART SOUNDS:

 (with a stethoscope listen to the 1st and 2nd heart sounds;
 normal = lub-dub, lub-dub; abnormal = everything else)
 NORMAL (101) ABNORMAL (102) (PVC'S S₃/S₄)

PERCUSSION:

 (percuss both front & back; dull = less resonant than normal, hyper-
 resonant = markedly more resonant than normal; otherwise circle normal)
 NORMAL (103) DULL (104) HYPER-RESONANT (105)

CHEST SOUNDS:

 (compare left to right sides; rhonchi = continuous musical sounds;
 rales = discrete, non-continuous sounds; decreased = one side
 markedly decreased)
 NORMAL (106) RHONCHI (107) RALES (108) DECREASED (109)

SGOT:

 (enzyme test)
 <50 (110) 50-100 (111) 101-200 (112) >200 (113)

BODY BUILD:

 (obviously overweight = obese; otherwise circle normal)
 NORMAL (114) OBESE (115)

DURATION OF PAIN (REFINED):

 (complete this item only for repeated examinations of the patient)
 <6HR (116) 6-24HR (117) >24HR (118)

EXAMINER'S OPINION OF THE PATIENT'S CONDITION:

 (how sick do you feel the patient is)
 GOOD (119) FAIR (120) POOR (121)

CORPSMAN'S DIAGNOSIS:

EXAMINING CORPSMAN:

EXAMINING M.O.:

2.4 DIAGNOSTIC CATEGORIES:

The diagnostic program is intended to specifically diagnose four of the most common and the most serious causes of chest pain in the submarine population. These categories are: acute myocardial infarction (M.I.), angina (ANGINA), pneumonia (PNEUMO), and pneumothorax (THORAX).

In addition, a fifth category termed nonspecific chest pain (NONSCP) is intended to include those conditions which are vague and general in nature and which are amenable to symptomatic treatment. Occasionally, the practitioner will pinpoint a "specific" diagnosis (i.e., esophagitis) in this category, but in all cases NONSCP is intended to encompass those conditions which are non-life-threatening and not a reason for medical evacuation.

There are several causes of acute chest pain (pulmonary embolism, pericarditis, aortic dissection) which are not included in the above categories, yet are of a serious nature. The program will yield the diagnosis of the category which most closely reflects the sign/symptom complex of a serious illness for which there is no specific category. Thus, the practitioner must utilize his clinical judgment both when gathering and entering the data and when interpreting the results of his computer interaction. A discussion of each diagnostic category is presented below.

SPECIFIC DIAGNOSES -

A. MYOCARDIAL INFARCTION : Myocardial infarction (M.I.) is a leading cause of mortality and morbidity in the population of the western, affluent civilization. In the United States, the annual incidence is approximately 1,000,000 cases weighted towards a middle age or older age group. Pre-hospital mortality approaches 50%. M.I. is acute necrosis of myocardium secondary to a sudden interruption or decrease of blood supply. Major risk factors are hypertension, hyperlipidemia, and smoking. Diabetes and angina are related risk factors unlikely to be present in the submarine population.

A history of acute onset of crushing substernal chest discomfort radiating to the left arm and accompanied by diaphoresis, nausea, and a sense of impending doom is classic. The pain lasts longer than 20 minutes and is unrelieved by rest and nitroglycerin. Physical exam ranges from near-normal to obvious shock. An electrocardiogram (ECG) taken early in the course is abnormal less than 50% of the time, but may show ST elevation, T wave inversion, or left ventricular hypertrophy. Q waves appear later. Cardiac enzyme determinations may be helpful but are unavailable at sea. Variations in the presentation are legion and well-documented. Diagnosis must be made on clinical grounds incorporating risk factors, the history and physical exam, the ECG (if available), and the practitioner's impression of the patient's overall condition.

B. ANGINA : Relative myocardial ischemia from an imbalance in myocardial oxygen supply versus demand is believed to be the basis for angina pectoris. Risk factors are the same as for M.I. Angina (ANGINA) is commonly described as substernal chest pain, pressure, tightness, or burning sensation that may radiate to the left arm (or elsewhere). The discomfort is relieved within 1-5 minutes of resting and/or by nitroglycerin.

The physical exam is usually normal. Cardiac examination, during an episode of pain, may reveal an S_3 , a mitral regurgitant murmur, or a systolic bulge that disappears as the pain subsides. The ECG is usually normal but may show ST depression which later resolves. Cardiac enzymes are normal, although such testing is unavailable at sea.

Diagnosis is made on the assessment of risk factors, the history and physical exam, the ECG (if available), and the response to rest and nitroglycerin.

Variant or "rest" angina, also known as Prinzmetal's angina, is due to coronary artery spasm. There is a good response to nitroglycerin but not to rest. The ECG may show transient ST elevation.

Recurrent and frequent episodes of angina may be a harbinger of impending M.I. The episodes may occur given less cardiopulmonary stress and be less responsive to rest and nitroglycerin than typical episodes.

C. PNEUMONIA : Pneumonia (PNEUMO) is an alveolar infection caused by a bacterium, virus, or other non-bacterial pathogen. Pneumococcal (bacterial) pneumonia is most likely in the isolated case. Mycoplasma (non-bacterial) or viral pneumonia is more common when groups of people are ill. Chest pain as a component of pneumonia is due to pleuritic or bronchial irritation. The pain may be felt anywhere in the thorax and is exacerbated by coughing or deep breathing. The "pleuritic component" to the pain distinguishes it from M.I. or ANGINA. Additionally, pneumonia is characterized by coexisting or recent upper respiratory tract symptoms, malaise, fever, chills, and sputum production. Dyspnea, tachypnea, and tachycardia may be present.

Physical exam reveals varying degrees of vocal fremitus, egophony, dullness to percussion, rhonchi, and rales. These signs are worse with bacterial pneumonia.

A lung infiltrate is usually visible on chest roentgenogram, but this study is unavailable aboard ship. The white blood cell count is elevated in bacterial pneumonia, but near-normal or depressed otherwise. Mycoplasma pneumonia is common in young adults and varies from the milder illness of a viral pneumonia to the more serious bacterial pneumonia. A right lower lobe pneumonia will occasionally present as abdominal discomfort in a younger person. A compatible history and rales in the lung field, that do not clear with cough, are the best indicators of the presence or absence of pneumonia.

D. PNEUMOTHORAX : Pneumothorax (THORAX) involves a degree of collapse of a lung secondary to entrance of air into the potential space between visceral and parietal pleura. Spontaneous pneumothorax develops de novo from rupture of an existing pulmonary bleb or occurs during respiratory infection. Cough or another mechanism whereby intra-alveolar pressure is elevated may be a precipitating factor. Penetrating chest trauma and rib fracture are other causes.

There is an acute onset of chest discomfort on the side of the pneumothorax, with a pleuritic quality to the discomfort. Dyspnea, tachypnea and cyanosis may be present with a large pneumothorax.

Physical exam reveals absent breath sounds and hyper-resonance overlying the pneumothorax. The trachea may be deviated away from the affected side. There is no fever or accompanying respiratory infection, unless pre-existent. Subcutaneous emphysema may be present in the chest wall or neck area if the parietal pleura is torn.

The pneumothorax is visible on chest roentgenogram, although this study is unavailable on a submarine. White blood cell count is normal unless there is acute distress, whereupon it might be elevated moderately. Occasionally, a "one-way valve" effect exists leading to the life-threatening tension pneumothorax. Usually, the non-tension pneumothorax stabilizes within a few minutes.

NON-SPECIFIC CHEST PAIN -

Non-specific chest pain (NONSCP) is intended to encompass those disorders which are not serious and not a cause for medical evacuation. Pain in this category is often more annoying than worrisome to patients. This aspect is helpful in diagnosis.

The likelihood of chest pain being due to non-specific causes varies with the age of the patient and clinical circumstances of the case. In a young adult without previous or recent medical illness, a serious cause for chest pain is unlikely.

Non-specific causes for chest pain include: a) musculoskeletal pain; b) costochondritis (Tietze's syndrome); c) esophagitis; d) esophageal spasm ("esophageal angina"); e) hyperventilation syndrome; f) psychoneurotic disorder; g) epigastric lesions (cholelithiasis, peptic ulcer, etc.).

Musculoskeletal pain and costochondritis denote muscle, rib, or cartilage pain due to inflammation or trauma. The pain is often sharp, of moderate intensity, localized to the chest wall, and reproduced by direct manipulation of the affected area.

Esophagitis and esophageal spasm are felt substernally in the mid-chest and/or epigastrium. Esophagitis is caused by direct irritation from food or drink, by reflux of gastric contents, or by infection (the latter is uncommon in healthy people). There is a good response to liquid antacids, a fact which assists in diagnosis. Esophageal spasm may follow a meal and is accompanied by dysphagia. The pain is relieved by nitroglycerin, making differentiation from classic angina difficult. The concomitant dysphagia and lack of relationship to exercise may be helpful in diagnosis.

Hyperventilation syndrome is a relatively common cause of chest discomfort in an (already) anxious person. The accompanying breathlessness, palpitations, weakness, and response to re-breathing techniques are diagnostic.

In psychoneurotic disorders no physical etiology for chest pain is found. This diagnosis is best made by those skilled in psychiatric evaluation. It should be assumed that crewmembers with chest pain have a physical etiology for chest pain.

Disorders that present with epigastric pain such as gastritis, peptic ulcer, pancreatitis, and cholelithiasis may occasionally be confused with chest pain disorders. In most of these disorders, the abdominal exam is revealing -- any abdominal tenderness points to a non-chest source of the pain. The key issue is to avoid overlooking an atypical presentation of M.I. The assessment of risk factors, the history and physical exam (chest and abdominal), and the ECG (if available) are helpful in this regard.

SECTION 3 - PROGRAMMING DETAILS

3.1 THE DIAGNOSTIC PROGRAM

The chest pain tape is composed of two related programs: the diagnostic program and the prognostic program. The diagnostic program elements will be discussed in this section, and the prognostic program elements will be discussed in section 3.2.

The diagnostic program contains one main program (Program 10) and two small introductory programs which serve only to automatically lead the user into Program 10 when the tape is loaded.

The first page of program 10 is the initial option page from which the user may proceed to obtain datasheet definitions, treatment displays, the training program, or the diagnostic program.

If the datasheet definition pathway is chosen, once the user specifies the definition desired, the program searches for file 9 and accesses the definition desired by reading each definition as binary data until the appropriate definition is reached. Once read, the definition is displayed and, if a graphic display accompanies the definition, the appropriate display is produced by program 10. The program flow then returns to the original decision point.

The treatment suggestions and training programs do not yet exist. If either of these options are selected, the program will display a statement to this effect and return the user to the initial option page.

If the diagnostic interaction is chosen, program 10 finds the file (11) which contains the data entry reminders and summary page and serially displays them. The program loads the database and all variables are set to their initial values. The program continues on from this point as described in Section 2.

On the following pages each program (both data and programming) is reproduced with some programming notes to aid in understanding the flow of the program. Table 3-1 lists the programs as they are stored on the tape and in the order in which they will be discussed.

PROGRAMS 3-6 SPACE ALLOCATED FOR TREATMENT DISPLAYS

Programs 3-6 are currently empty. These files allocate space for the inclusion of chest pain treatment regimes.

PROGRAM 7 - PROGNOSTIC PROGRAM
PROGRAM 8 - PROGNOSTIC PROBABILITIES
DISPLAY PAGES

Programs 7 and 8 pertain to the prognostic program. These program elements will be discussed in Section 3.2.

PROGRAM 9 - DATASHEET DEFINITIONS

Program 9 contains the datasheet definitions stored as BINARY DATA in order of their appearance on the datasheet and definition selection display. The data strings are sequentially read until the desired definition string is accessed and the string is then automatically printed. The graphic display contained in the "CHEST SOUNDS" definition is constructed by the main diagnostic program.

In total, there are 32 definition strings. Age, as usual, is taken to the last birthday. In addition, there are no definitions for symptom categories pertaining only to the prediction of prognosis (Body build, Duration of pain (refined), and Examiner's opinion of the patient's condition).

The reader is asked to refer to Section 2.2 for a complete listing of datasheet definitions.

PROGRAM 10 - DIAGNOSTIC PROGRAM

The following pages list the main diagnostic program and highlight some of the important programming features. The line demarcations below serve to aid in the understanding of program organization.

<u>LINES</u>	<u>FUNCTION</u>
100 - 700	Display and choose initial choice, read in all initial displays and databases
1000 - 1379	Begin diagnostic interaction, 'last case', input patient's personal data
1400 - 1440	Display datasheet pages including graphics
3000 - 3640	Data input routine
4010 - 4590	Preliminary diagnosis comparison routine
4620 - 4800	Reconstruct 'last case' from memory (J\$)
5000 - 6000	Case summary page construction
6010 - 6310	Entry of case into 'last case' file and datafile
6320 - 6340	Treatment files not yet created
7010 - 7280	Input change routine, GOSUB data input subroutine
8000 - 8200	Graphics to circle and 'X' data entries
9000 - 10030	Display definition choices, add graphics to 'Chest Sounds' definition
12000 - 15540	Draws graphics for page 2 of datasheet
16000 - 16090	Underlines major headings on datasheet pages

PROGRAM 11 - DATA ENTRY REMINDERS
SUMMARY PAGE
DATASHEET ITEM NAMES AND DATABASE

Program 11 contains three BINARY DATA strings. The first two data strings are the displays for the 'data entry reminders' and the 'summary page', both of which are displayed at the beginning of the diagnostic program. Initial construction of these data strings required input of test 'operators.' String construction was performed by utility programs and entered onto the file as data. They cannot be read out literally since the text operators perform their designated functions when printed. The following two displays are the individual strings as they appear when printed.

DATA ENTRY REMINDER STRING -

REMEMBER... 1. Use DATASHEETS when entering data.
2. Enter information by CODE NUMBER.
3. Follow each code number with RETURN.
4. RE-ENTER codes to erase.
5. INPUT CHANGES can be made at the END.
6. Press RETURN to go on to next page.

Press RETURN to continue.

SUMMARY PAGE STRING

The computer-assisted diagnosis program can aid the Corpsman in differentiating illnesses which represent both the most common and most serious causes of acute chest pain.

The five illnesses which are considered by the computer are MYOCARDIAL INFARCTION, ANGINA, NON-SPECIFIC CHEST PAIN, PNEUMONIA, and PNEUMOTHORAX. Non-specific chest pain is intended to include those cases which are non-surgical, not life-threatening, and, therefore, not reasons for evacuation.

In addition to diagnosis, the chest pain computer program provides probabilities for the occurrence of 3 classes of post M.I. complications. These are: NO PROBLEMS, ARRYTHMIA, and PUMP FAILURE. It also predicts the likelihood of LIFE/DEATH post M.I.

IMPORTANT: Supplemental programs for the prediction of complications and the prediction of life/death are used only with cases of M.I.

THE CORPSMAN'S JUDGMENT MUST TAKE PRECEDENCE when any doubt exists. The computer does not have the capability to think or make the subjective evaluations which are so important in medical diagnosis.

The last character string is the diagnostic database (B\$). The diagnostic database has three components; the first (SEG 1 to 3390) contains the datasheet item names and is used to construct the Case Summary Page, the second (SEG 3391 to 4520) contains the conditional probabilities used to compute the diagnostic probabilities as each datasheet item is entered, and the third section contains the datasheet item number display coordinates in ASCII format.

The datasheet item names are contained in 30 character segments. Access to a particular item name merely requires multiplying the item number by 30 and accessing the preceding 30 characters (see lines 5140 & 5200 of the diagnostic program).

The conditional probabilities are in segments of 10 characters; two characters for each diagnostic category. Access to one group of conditional probabilities requires multiplying the item number by 10, adding 3390 (length of datasheet names), and accessing the preceding 10 characters. NOTE: The conditional probabilities cannot be released at this time.

The datasheet item number display coordinates are appended to the end of the conditional probabilities and are in ASCII format and, therefore, not amenable to literal display. Each coordinate is composed of two characters which, when converted to 'real' numbers, are separated by a decimal point to yield the exact location of each datasheet item number on the display screen.

DIAGNOSTIC DATABASE (B\$) (First segment only)

PROGRAM 13 - NAME, CASE COUNTER, LAST CASE MEMORY

PROGRAM 13 allows space for the name of the boat to which the tape belongs (N\$; at the present time, the name has been set to NAVSUBMEDRSCHLAB), the case counter (Q), and the 'last case' stored as J\$. The name is a string 50 characters long and is accessed by 'READ@33:N\$'. The case counter is an 8 column array where Q(1) through Q(5) represent the number of cases of each category which have been placed into memory as either simulated or real cases. Q(7) and Q(8) represent the number of real and simulated cases, respectively. The Q array must be dimensioned to 8 before reading. The last case is stored after Q as a 147 character string (refer to lines 6050 - 6189 for segmental listing), J\$.

PROGRAMS 14 THROUGH 27 - DATAFILES

PROGRAMS 14 through 27 allow space for all cases which are placed into memory. Each datafile is 'primed' with the name of the research laboratory (NAVSUBMEDRSCHLAB) as a 50 character string and each case run on the diagnostic program is sequentially added to each file to a maximum of 40 cases in each file. After the 40th case, the next case is entered onto the next datafile. If all datafiles become full (containing 560 cases), data will no longer be entered onto datafiles but will still be entered into file 13 as the 'last case'.

3.2 THE PROGNOSTIC PROGRAM (PROGRAM 7)

The prognostic program calculates probabilities that a patient suspected of MYOCARDIAL INFARCTION will develop one of three kinds of problems (No problems, Arrhythmia, and Pump failure) and the likelihood that the same patient will live or die even if placed in a hospital.

The user accesses the prognostic program by way of the chest pain diagnostic program (Program 10). The chest pain diagnostic probability must be highest for MYOCARDIAL INFARCTION before the user is given the option to obtain prognostic probabilities.

On the following pages the program is reproduced with some notes to aid in understanding the flow of the program. The line demarcations below serve to provide additional information regarding program organization.

<u>LINES</u>	<u>FUNCTION</u>
100 - 410	Sets variables and calculates probabilities for problems using symptom profile from diagnostic program
420 - 910	Case summary page construction
912 - 1040	Resets variables, display additional symptom page
1045 - 1250	Additional data input subroutine
1265 - 1790	Calculates probabilities for live/die prognosis, goes to case summary page and draws bar graph
1792 - 1910	Augments case memory string with additional symptoms, saves it in data file and then offers choices for next interaction
5000 - 5050	Calculates running probabilities
8000 - 9020	Draws circle or 'X' for input page

PROGRAM 8 - PROGNOSTIC PROBABILITIES AND DISPLAY PAGE

Program 8 contains three binary data strings (C\$, P\$, L\$). The first string contains probabilities for the calculation of prognostic problems (No problems, Arrhythmia, and Pump failure). The probabilities are stored in segments of 6 characters; two characters for each problem category. The conditional probabilities cannot be released at this time.

The second string (P\$) contains one display page string. This page requests data from the user for three additional symptom categories. The user's responses are employed in the calculation of probabilities that the patient will live or die even if placed in a hospital.

DISPLAY PAGE STRING

LIFE/DEATH Probabilities:

BODY BUILD:

NORMAL----(1) OBESE-----(2)

CORPSMAN OPINION OF PATIENT'S CONDITION:

GOOD----- (3) DUBIOUS--- (4) POOR----- (5)

DURATION OF PAIN (refined):

<6 HR----- (6) 6-24 HR--- (7) >24 HR---- (8)

The third string (L\$) contains conditional probabilities for the calculation of live/die probabilities (conditional probabilities cannot be released at this time), symptom names used by the program, and coordinates that identify the location of item numbers on the display page. Each coordinate is composed of two characters which, when converted to 'real' numbers are separated by a decimal point to yield the exact location of each datasheet item number on the display screen.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Chest pain is the presenting symptom for several very serious illnesses, some having potentially fatal outcomes. In addition, chest pain has been reported to be one of the most frequent causes of medical evacuation from submarines. The Naval Submarine Medical Research Laboratory is developing programs, in the style of the computer-assisted diagnosis program for acute abdominal pain, to assist the submarine corpsman in the diagnosis, triage, and management of chest pain illness. The purpose of the present report is to summarize and document the progress to date on the computer-based (cont'd)

diagnostic program for chest pain. The disorders considered are: myocardial infarction, angina, pneumonia, pneumothroax, and non-specific (non-life-threatening) chest pain. A very preliminary version of outcome of M.I. (myocardial infarction) is also presented.

As it stands, the chest pain diagnostic/prognostic program described here is not ready for clinical use. Revision of both parts of the program to incorporate ECG measures and recent findings regarding the indicant-disease relationships is in progress.
